Individual Demographics as Compared to Attitude on Global Warming within a Large, Student Population

**General Outline.** A large sample of young people was polled regarding attitudes on global warming. The survey was presented to different college classes over a three-year period and contains nearly 1,000 participants. The surveys included several questions concerning personal demographics, a few questions on knowledge of climate science and several established tests of attitude concerning the environment and climate change. These tests included the Brief Inventory of Values (Stern, Dietz, & Guagnano, 1998), the New Environmental Paradigm (Dunlap, Van Liere, Mertig, & Jones, 2000), and the Global Warming Attitude Test (Heath & Gifford, 2006; Joireman, Truelove, & Duell, 2010). Data compilation and analysis is now underway.
