Biosketch

I have over 20 years experience studying the interaction of the atmosphere and terrestrial biosphere, including the exchange of momentum, energy, moisture, and trace gases. An integral component of this research is the study of carbon cycle dynamics and vegetation constraint on the Bowen ratio, and bidirectional interaction between the atmosphere and land. My studies have used observations from surface, airborne, and satellite platforms on scales from a few km² (e.g. eddy covariance footprint) to ecoregions, continents, and the globe. I have developed and evaluated numerical models that simulate surface-atmosphere exchange across these scales. I have experience developing and evaluating models that explore the use of novel methods to constrain estimates of the Bowen ratio and surface gas exchange. These include the representation of discrimination of carbon isotopes across the stomate and during photosynthesis, the exchange of Carbonyl Sulfide (OCS, or COS) between the atmosphere and plants and soils, and the simulation of Solar Induced Fluorescence (SIF) in numerical models. I have considerable experience with the representation and influence of the soil moisture constraint on vegetation status and evapotranspiration. I also have experience in evaluating the dependence of simulated surface-atmosphere fluxes and processes on parameterizations and spatial scale of models. I collaborate broadly with researchers around the globe, and have presented my results widely at conferences, workshops, and in the refereed literature.
